Chapter 13
Planar Graphs and Colorings

13.1 Planar Graphs

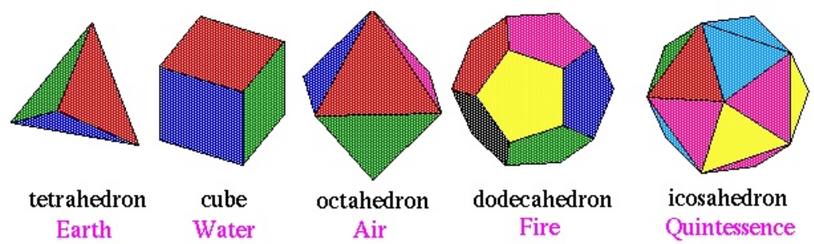
Planar Graphs

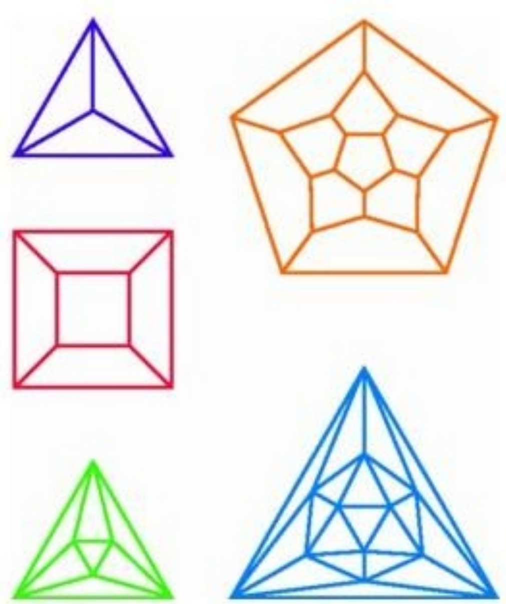
A graph is planar if it can be drawn in the plane so that no two edges cross.

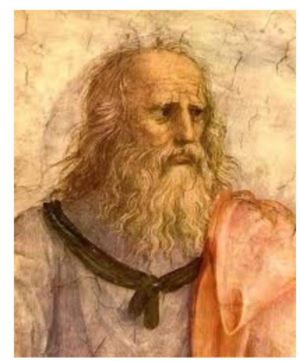
The Three House-Three Utility Problem asks whether or not $K_{3,3}$ is planar.

Platonic Solids

One collection of interesting planar graphs comes from the five Platonic solids:



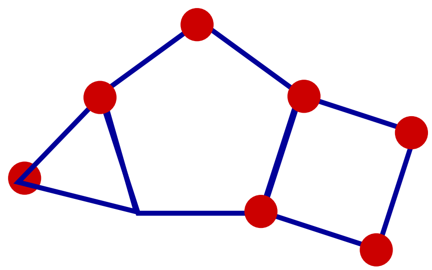


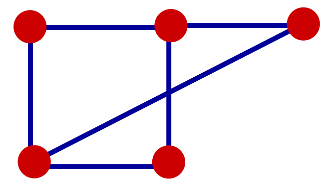


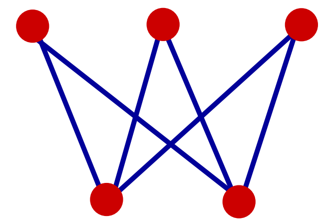
Plato

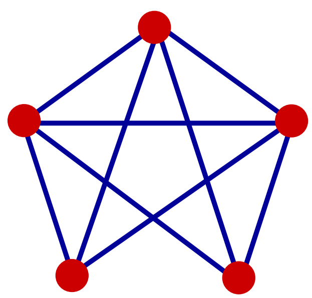
Planar Graphs

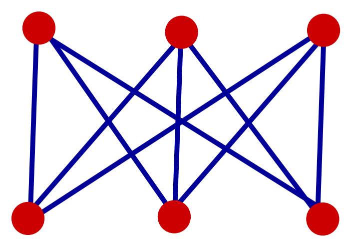
Which of the following graphs are planar?







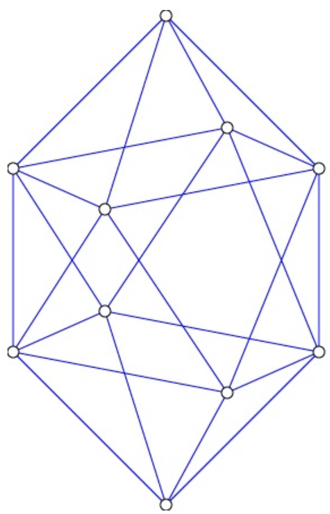




Note: First translate each graph from a picture of a graph to an abstract graph.

PLANAR GRAPHS

To show that a graph is planar, you just need to draw it in the plane with no crossings:

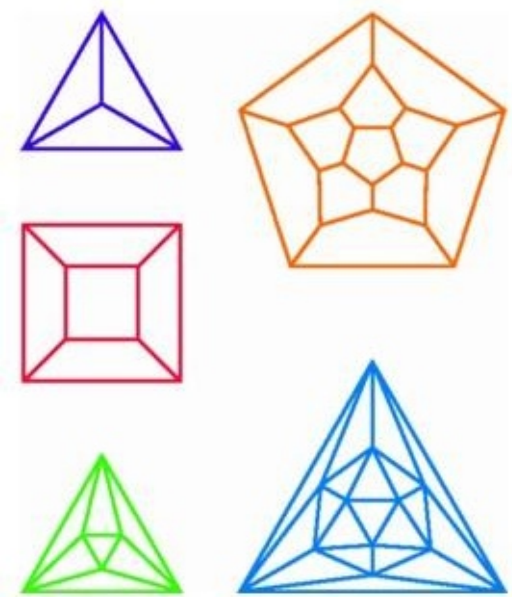


But how do we show a graph is <u>not</u> planar? For example, what about $K_{3,3}$? Is it possible to try all possible drawings? How many ways are there to draw $K_{2,2}$ or $K_{3,2}$ without crossings? Is there a better way?

Vertices, Edges, and Faces

A planar drawing of a planar graph divides the plane into distinct regions, or faces.

	vertices	edges	faces
tetrahedron			
cube			
octahedron			
dodecahedron			
icosahedron			



What is the pattern?

Euler's Theorem

Theorem. Any planar drawing of a graph with V vertices, E edges, and F faces satisfies

In 1988, the Mathematical Intelligencer ran a survey. It was decided that the 5 most beautiful results in mathematics were:

(i) Euler's identity $e^{ix} = \cos x + i \sin x$
(ii) Euler's polyhedral formula $V - E + F = 2$
(iii) Euclid's proof of the infinitude of the primes
(iv) Euclid's proof that there are only 5 regular solids
(v) Euler's summation $\sum 1/n^2 = \pi^2/6$

EULER'S THEOREM

THEOREM. Any planar drawing of a connected graph with V vertices, E edges, and F faces satisfies

PROOF.

Platonic Solids

A Platonic solid is a 3-dimensional solid with polygonal faces, and satisfying:

(i) The faces are regular and congruent.
(ii) The same number of faces meet at each vertex.
(iii) The line connecting any two points on the solid is contained in the solid.

THEOREM. There are exactly 5 Platonic solids.

PROOF.

$K_{3,3}$ is not Planar

Theorem. $K_{3,3}$ is not planar.

Proof.

K_5 IS NOT PLANAR

THEOREM. If a planar graph has V vertices and E edges, then $E \leq 3V - 6$.

PROOF.

COROLLARY. K_5 is not planar.

PROOF.

Degrees

Theorem. Every planar graph has at least one vertex whose degree is less than 6.

Proof.

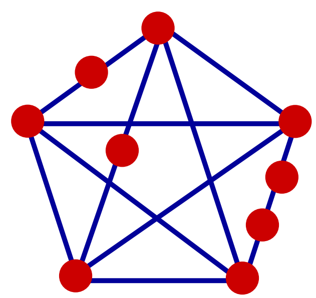
More Nonplanar Graphs

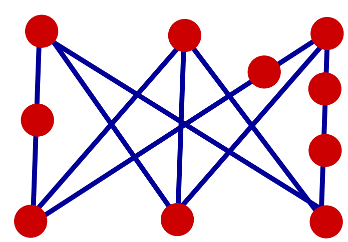
So far, we know K_5 and $K_{3,3}$ are not planar.
It follows that K_n is not planar for $n \geq 5$,
$K_{m,n}$ is not planar for $m,n \geq 3$.

More generally:

PROPOSITION. Any graph that
is not planar.

Note also any subdivision of K_5 or K_3 is nonplanar:





PROPOSITION. Any graph that contains
is not planar.

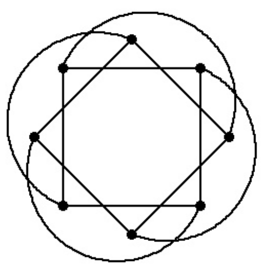
Kuratowski's Theorem

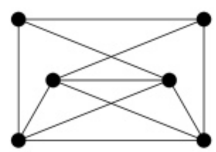
Amazingly, the converse is also true:

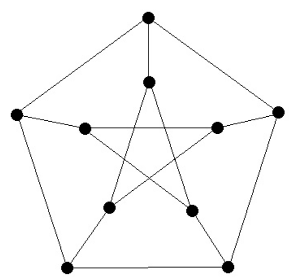
Theorem. A graph is planar if and only if it contains no subgraph that is a subdivision of K_5 or $K_{3,3}$.

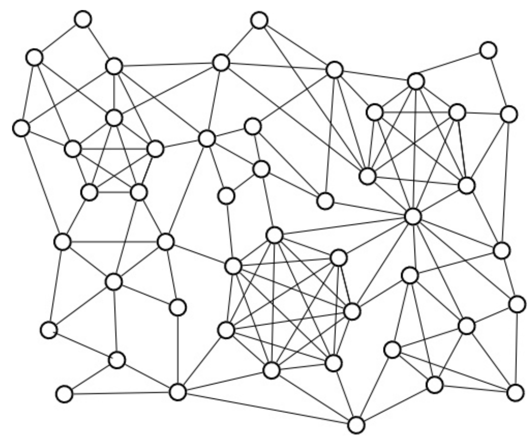
Proof. See web site.

Which of the following graphs are planar?





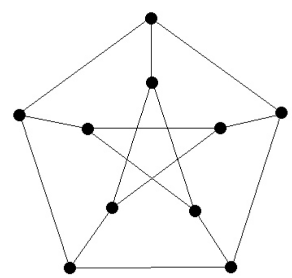




Wagner's Theorem

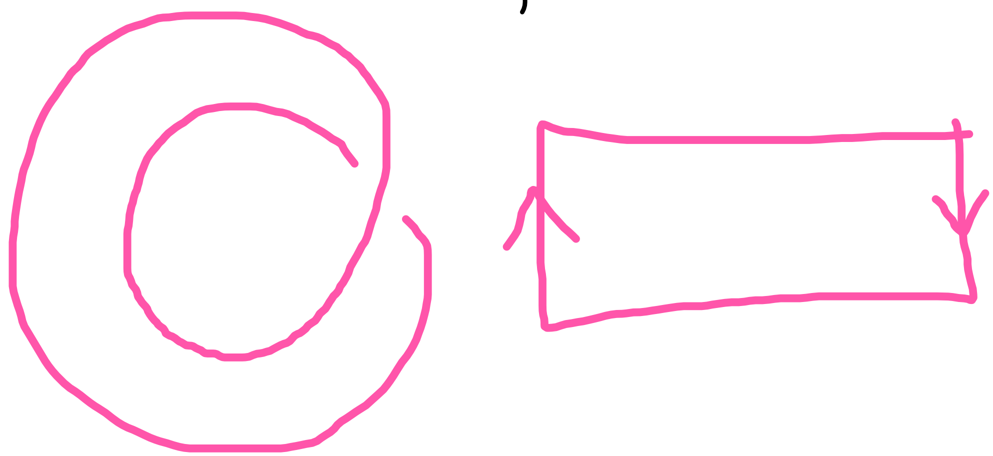
A graph H is a minor of a graph G if H is obtained from G by taking a subgraph and collapsing some edges.

THEOREM. A graph is planar if and only if it does not contain K_5 or $K_{3,3}$ as a minor.



OTHER SURFACES

What are the largest m, n so K_n and $K_{m,n}$ can be drawn without crossings on a Möbius strip



or a torus?
